AI-assisted Diagnosis for Prostate Cancer

Chacha Chen, Han Liu, Jiamin Yang,
Aritrick Chatterjee, Aytekin Oto, Chenhao Tan

Prostate cancer diagnosis is very challenging...

The diagnostic performance (AUC) of our trained AI model using bpMRI for detecting clinically significant cancer, was higher than human radiologist on case-level analysis (**0.80** vs **0.58**).

How can we use AI assistance in diagnosis?

AI assisted Diagnosis

AI Prediction Map

This system assists radiologists by providing AI-generated predicted cancer maps.

Interactive learning & Visualization

We have developed a web-based system for interactive and learning resources for radiologists, incorporating the trained AI model.

Visualization & Annotation

With this information at their disposal, radiologists can make their own predictions and make annotations.

The user found the right posterior Gleason 3+4 cancer (lesion 1), but picked a false positive on the left (lesion 2).

If you want to learn more about the model, feel free to reach out to Chacha Chen (chacha@uchicago.edu)
